About this guide

This guide is for use by system administrators who have expertise in:

- Disk arrays and RAID technology
- Operating system commands and utilities
- Data processing concepts
- Direct-access storage device subsystems and their basic functions

This document describes the general operations, components, specifications, and options for the HP StorageWorks Disk Array XP128 and XP1024.

Unless otherwise noted, the term disk array refers to the HP StorageWorks XP128 and/or XP1024 Disk Array.

**Caution**

*Indicates that failure to follow directions could result in damage to equipment or data.*

**Warning**

*Indicates that failure to follow directions could result in injury or death.*

**HP technical support**

In North America, call technical support at 1-800-633-3600, available 24 hours a day, 7 days a week.

Outside North America, call technical support at the location nearest you. The HP web site lists telephone numbers for worldwide technical support at: http://www.hp.com/support. From this web site, select your country.

Collect the following information before calling:

- Technical support registration number (if applicable)
- Product serial numbers
- Product model names and numbers
- Applicable error messages
• Operating system type and revision level
• Detailed questions

For continuous quality improvement, calls may be recorded or monitored.

HP strongly recommends that customers sign up online using the Subscriber’s choice web site at http://www.hp.com/go/e-updates. Subscribing to this service provides you with email updates on the latest product enhancements, newest versions of drivers, and firmware documentation updates as well as instant access to numerous other product resources.

**HP storage website**

For the most current information about HP StorageWorks XP products, visit: http://h18006.www1.hp.com/storage/arraysystems.html.

For information about product availability, configuration, and connectivity, contact your HP support representative.

**HP sales and authorized resellers**

To reach HP sales or find a local authorized reseller of HP products, call 1-800-282-6672 or visit the HP How To Buy web site:

You can also find HP sales and resellers at http://www.hp.com. Click Contact HP.

The Disk Array XP128 and Disk Array XP1024 are part of the HP StorageWorks Disk Array family of products. These disk arrays provide reliable and secure data storage and protection, featuring redundant circuitry and RAID storage options for data security. These disk arrays also support multiple operating systems, platforms, and RAID groups. The advantages include:

- Continuous data availability
- Nondisruptive service and upgrades
- Connectivity
- Scalability
- Data integrity
Continuous data availability

The HP StorageWorks Disk Array XP family are the first RAID disk arrays to provide truly continuous data availability. They are designed for nonstop operation and continuous access to all user data.

HP StorageWorks Disk Array XP128 and XP1024 disk arrays have no single point of component failure, which enables uninterrupted access to data.

The disk array has component and function redundancy, providing full fault tolerance for disk array microprocessors, control storage, control and data buses, power supplies, and cooling fans. The disk array can sustain multiple component failures and still continue to provide full access to your stored data.

While access to your data is never compromised, the failure of a key component can cause a temporary reduction in disk array performance.
Nondisruptive service and upgrades

Monitoring software detects internal hardware component problems and notifies the HP Storage Technology Center automatically. At the support center, the problem is verified and the appropriate maintenance activity is executed by an HP service representative. There are no user serviceable components. Only an HP service representative should open the cabinets.

All hardware subassemblies can be removed, serviced, repaired, or replaced non-disruptively during disk array operation. All microcode upgrades can be performed during normal disk array operations (provided array connectivity infrastructure requirements are satisfied), using your disk array’s built-in service processor (SVP). Alternate paths can be set by host failover software and/or alternate Fibre Channel paths.
Connectivity

The HP StorageWorks Disk Array XP128 and HP StorageWorks Disk Array XP1024 are connected to host systems using one of these types of connections:

- Fibre Channel
- ESCON
- FICON
- iSCSI

Fibre Channel connectivity

**HP StorageWorks Disk Array XP128**

The XP128 supports a maximum of three pairs of channel adapters that can support up to 48 Fibre Channel ports. Your disk array can support up to 8,192 LDEVs which can be configured as up to 24,576 LUNs through the Fibre Channel. The Fibre Channel provides data transfer rates up to 2GB/sec depending on which Fibre Channel interface option is installed. The disk array can support Fibre Channel Arbitrated Loop (FC-AL) and Fabric Fibre Channel topologies.

**HP StorageWorks Disk Array XP1024**

The XP1024 supports a maximum of four pairs of channel adapters that can support up to 64 Fibre Channel ports. Your disk array can support up to 8,192 LDEVs which can be configured as up to 32,768 LUNs through the Fibre Channel. The Fibre Channel provides data transfer rates up to 2GB/sec depending on which Fibre Channel interface option is installed. The disk array can support Fibre Channel Arbitrated Loop (FC-AL) and Fabric Fibre Channel topologies.
ESCON connectivity

**HP StorageWorks Disk Array XP128**

The XP128 supports a maximum of three pairs of channel adapters that can support 24 ESCON ports for connection to mainframe hosts. The disk array can support up to 8,192 LDEVs.

**HP StorageWorks Disk Array XP1024**

The XP1024 supports a maximum of six pairs of channel adapters that can support 48 ESCON ports for connection to mainframe hosts. The disk array can support up to 8,192 LDEVs.

Note: When more than four pairs of ESCON channel adapters are configured, the number of disk drives that can be installed is reduced. Other restrictions may apply, depending on what other types of channel adapters are installed.

FICON connectivity

**HP StorageWorks Disk Array XP128**

The XP128 supports a maximum of three pairs of channel adapters that can support up to 24 FICON ports. The disk array can support up to 8,192 LDEVs.

**HP StorageWorks Disk Array XP1024**

The XP1024 supports a maximum of four pairs of channel adapters that can support up to 32 FICON ports. The disk array can support up to 8,192 LDEVs.
iSCSI connectivity

**HP StorageWorks Disk Array XP128**

The XP128 supports a maximum of three pairs of channel adapters that can support up to 24 iSCSI ports. The disk array can support up to 6,144 LDEVs through iSCSI.

**HP StorageWorks Disk Array XP1024**

The XP1024 supports a maximum of four pairs of channel adapters that can support up to 32 iSCSI ports. Your disk array can support up to 8,192 LDEVs through iSCSI.
Data integrity

HP disk arrays provide the highest levels of data integrity. This is accomplished using RAID technologies, together with redundant hardware throughout the disk array. The following hardware features allow the HP StorageWorks Disk Array XP family to achieve its high availability and data integrity:

- RAID1, RAID5
- Mirrored write cache
- Dual channel adapters (CHAs) and array control processors (ACPs)
- Dual and concurrently active data and control paths through the array
- Split power domains on internal data paths
- Hot-pluggable boards
- Hot-pluggable fans, power supplies, and controllers
- Online upgradable firmware
Some of the available software features and products that complement the disk array hardware are listed below:

- HP StorageWorks Disk Array XP128 support
  “Phone Home” capability to the multidisciplinary Storage Technology Center
  advanced remote diagnostics
  full solution (Host-SAN-Storage) support

- Full software and solution integration
  local and remote mirroring for online backup and disaster recovery (HP StorageWorks Business Copy XP and Continuous Access XP)
  security for multiple server consolidation (HP StorageWorks LUN Configuration and Security Manager XP)
  zero downtime backup (HP OmniBack, Exchange, Oracle, or SAP)
  centralized resource management (HP StorageWorks Remote Web Console XP, HP StorageWorks Command View XP, HP StorageWorks SAN Manager LM/DM, Performance Advisor XP and Auto LUN XP)

- I/O path failover and load balancing (HP StorageWorks AutoPath XP). To obtain updates to the software, go to the following main website and access the appropriate support product:

  http://www.hp.com

XP128 hardware
General safety guidelines

Read the following safety guidelines carefully and follow them when you work with the HP StorageWorks Disk Array XP128 disk array.

• Remember that the maintenance of your machine must be done only by trained and qualified HP field engineers. Only an HP service representative can power off the disk array in a non-emergency situation.

• Please read and follow the safety guidelines and procedures in this manual and you other disk array manuals.

• In this manual and on the machine, hazard warnings are provided to aid you in preventing or reducing the risk of death, personal injury, or product damage. Understand and follow these hazard warnings fully.

• The hazard warnings that appear on the warning labels on the machine or in the manual have one of the following alert headings consisting of an alert symbol and a signal word, “Warning,” or “Caution”:

<table>
<thead>
<tr>
<th>Alert Symbol</th>
<th>Signal Word</th>
</tr>
</thead>
<tbody>
<tr>
<td>!</td>
<td>Warning</td>
</tr>
<tr>
<td></td>
<td>Caution</td>
</tr>
</tbody>
</table>

Warning

This indicates a potentially hazardous situation which, if not avoided, can result in death or serious injury.

Caution

This indicates a hazardous situation which, if not avoided, will or can result in serious damage to the product or loss of data.

• The signal word “NOTICE” is used to present warnings that are not directly related to personal injury hazards.

• When warning labels become dirty or start peeling off, replace them.

• If any physical accident such as abnormal noise, smell, or smoke occurs on the disk array while it is running, immediately power off the disk array by pulling the UNIT EMERGENCY POWER OFF switch on the disk array.
• Do not power off the system unless it is an emergency power-off situation.

• Keep the front and rear doors closed at all times.

• Keep the tops and sides of the cabinets clear to allow air to flow properly.

• Do not perform any procedures not described in this document. If you have any questions or concerns, please contact your HP service representative.

---

**Warning**

Do not touch areas marked HAZARDOUS, even with the power off. These areas contain high-voltage power.

Keep in mind that the hazard warnings in this manual or on the machine cannot cover every possible case, as it is impossible to predict and evaluate all circumstances beforehand.

Follow the procedures in this guide carefully and always be alert for any unusual equipment indications or behavior. If you have any questions, contact your HP service representative.
Physical components

The HP StorageWorks Disk Array XP128 is a high-performance disk array system. It is used to store large quantities of data in an efficient and secure manner.

![Image of HP StorageWorks Disk Array XP128]

Figure 1. HP StorageWorks Disk Array XP128

Your disk array has the following major hardware components:

- **Disk array cabinet**
  
  The single disk array frame cabinet contains the control panel, connection hardware, the service processor, control boards and hard disk drives.

- **One service processor (SVP)**
  
  The service processor (SVP) is a built-in PC inside the disk array cabinet. The SVP gives your HP service representative a method of accessing the software system on the disk array.

  Your HP service representative uses the SVP to configure, maintain, and upgrade your disk array software and hardware. The service
processor also collects performance data about the disk array for diagnostic testing and analysis.

To ensure data security, the SVP does not have access to any user data stored on the disk array.

• *(Optional)* second service processor

This is available for users with extreme high availability requirements. This is not a required feature.

• Control panel

The control panel is your view of the disk array. Once the disk array is powered on and running normally, there are no user operations required at the control panel, except in the case of a power failure recovery. The control panel is discussed in further detail on page 29.

• Hard disk drives

The disk array uses 3.5-inch disk drives, and different disk capacities are available. Ask your HP service representative about currently available disk drives or visit the XP128 web site at http://www.hp.com. Any of the disk drives in the disk array frames can be replaced without disrupting user activity. The disk array automatically detects and corrects disk errors.

• *(Optional)* Device Manager server

The Device Manager server is attached to your disk array by a local area network (LAN) connection. The Device Manager server runs HP Command View XP and/or Command View XP Advanced Edition which, combined with other optional applications, allows you to monitor and manage disk array operations.

The following figure illustrates how the Device Manager server and host connect to the XP128.
Figure 2. The XP128 connections

1. The management station connects to the XP128 by means of a public LAN connection. The XP128 has an Ethernet connection for this purpose.

2. The host server uses a Fibre Channel, FICON, iSCSI, or ESCON connection.

The hardware requirements for your Device Manager server, such as the required processor speed, storage capacity, and memory, will vary depending on the optional software that you use and the number of disk array frames you have connected to the system.

To ensure data security, neither edition of HP Command View software (CVXP or CVXP AE) has access to any user data stored on the disk array.

There is no single point of failure in the disk array. It is designed with redundant logic assemblies, disk drives and power supplies, all of which can be removed or replaced without interrupting access to your data.

**Caution**

*Only your HP service representative can remove or replace hardware.*
Figure 3 and Table 3 on page 30 show the control panel and its functions, respectively.

Emergency power-off

A switch is provided on the control panel for an emergency powering off. See Figure 4 on page 35.

If you detect an abnormal sound, smell, or smoke, power off the disk subsystem by operating the UNIT EMERGENCY POWER OFF switch following the procedure below. The procedure for operating the switch is as follows:

1. Push the operator panel cover at the location where PUSH is marked, open the operator panel cover, then operate the EMERGENCY POWER OFF switch.

2. In using a UNIT EMERGENCY POWER OFF switch, first pull it up and then pull it toward you as illustrated in the figure below.

Caution

Pulling the UNIT EMERGENCY POWER OFF switch on the disk array cabinet instantly shuts down the array, neglecting the system’s power-off sequence. Jobs in process are aborted and their integrity after recovery is not guaranteed. Therefore, this method should be used only in an emergency and not in normal operation.

Caution

The UNIT EMERGENCY POWER OFF switch on the disk array cabinet only partially removes power from the array. AC input power remains present at the primary circuit. Therefore, do not use the Emergency Power-Off switch unless you need to power off of the unit as an emergency measure.

When pulled, a UNIT EMERGENCY POWER OFF switch locks itself to prevent further powering on and requires a trained and qualified HP field engineer for recovery. Any time the unit Emergency/Only OFF switch is pulled, place a service call to Hewlett-Packard to have the switch reset and have the disk array restored to service.
Figure 4. Pulling Unit Emergency Power OFF Switch
Normal operations

The disk array does not require user intervention. The disk array automatically reports any remote system information messages (R-SIMs) to your Device Manager server running HP Command View XP or Command View XP Advanced Edition, to the internal disk array service processor, and also to the HP Service Center. For more information on SIMs, see Chapter 5, "Troubleshooting" on page 87.
Powering down the disk array

Situations may arise in the operation of the disk array that require you to power down the disk array. These situations include:

- Emergency power-off
- Planned power-off

**Emergency power-off**

An emergency is a critical situation such as a physical plant catastrophe. In an emergency, the critical need is to quickly remove power from the disk array. A quick restart is not necessary.

In an emergency, the operator should trip the Emergency Power-Off (EPO) switch. The disk array emergency power-off (EPO) switch is located on the control panel.

**Caution**

*Use this switch only in case of an emergency. An HP service representative is required to reset the EPO and to power-on the disk array.*

To power off the disk array in an emergency:

1. Open the control panel cover by pushing on the point marked **PUSH**.
2. Pull the emergency power-off switch up and then out towards you as illustrated on the switch. See **Figure 4 on page 35**.
3. Call the HP support center. The EPO switch must be reset by an HP service representative before the disk array can be powered on again.

**Planned power-off**

There may be times when a site power outage is planned. These situations would include alterations to the data center, inspections, or work by the electric company. If a scheduled power outage affects an HP StorageWorks Disk Array XP128, the power down of the disk array must be scheduled with a trained HP support representative.
Caution

Only a trained HP representative can shut down and power-off a disk array. Shutting down and powering off a disk array is not a customer activity. A user should not attempt to power down the disk array at any time other than an emergency.

When planning for your planned power outage, please contact your HP CE to schedule a customer visit.
Recovering from a power outage to the disk array

If AC input power is lost, the disk array maintains its state and recovers when power is restored. The array cache is backed up by batteries that will maintain its state for a minimum of 48 hours. This length of time will provide coverage for most outages. In cases where the outage will extend beyond 48 hours, the batteries can be replaced by a HP to extend the time, if necessary. To extend the backup time beyond 48 hours, you must notify HP support in time to receive service.

Manual restart of the disk array after power is restored

**Caution** Before you restore power to the disk array after an outage, HP recommends you have an electrician check the power to ensure it is stable and clean.

You may opt to call a trained HP representative or you may restore power to the disk array yourself:

1. Move the ENABLE/DISABLE switch to the ENABLE position. Move the PWR ON/OFF switch to the PWR ON position (Figure 3 on page 29, items 11 & 12)

2. The following LED sequence will occur:
   - The BS-ON LED (Figure 3 on page 29, item 9) will turn amber and the PS ON LED (10, Figure 3 on page 29, item 10) will turn green.
   - The CHANNEL LED (Figure 3 on page 29, item 7) will light green for every adapter installed.
   - The MESSAGE LED (Figure 3 on page 29, item 3) may turn amber if your disk array is not configured for automatic maintenance notification, signifying a SIM was generated (because the disk array went down unexpectedly).

   Finally, the Ready LED (Figure 3 on page 29, item 1) will light green when the system is ready, which may take up to 10 minutes, depending on the number of disks installed in your disk array.

3. Move the ENABLE/DISABLE switch to the DISABLE position.
Automatic power on restart

**Caution**  
As with all sophisticated electronic equipment, unstable power during a restart can induce problems. Hewlett-Packard recommends automatic power on restart only when the power to the disk array is conditioned to ensure stability (for example, using a UPS). If your site does not have a UPS, HP recommends configuring the disk array for manual restart by keeping the ENABLE/DISABLE switch in the DISABLE position and using the manual restart procedure when power has been restored and verified.

Your disk array will automatically restart and return to service when power is restored. To enable this feature, place the ENABLE/DISABLE switch in the ENABLE position and the PWR ON/OFF switch in the PWR ON position (Figure 3 on page 29, items 11 & 12). When power is restored, your disk array will restart and the following LED sequence will occur:

- The BS-ON LED (Figure 3 on page 29, item 9) will turn amber and the PS ON LED (10, Figure 3 on page 29, item 10) will turn green.
- The CHANNEL LED (Figure 3 on page 29, item 7) will light green for every adapter installed.
- The MESSAGE LED (Figure 3 on page 29, item 3) may turn amber if your disk array is not configured for automatic maintenance notification, signifying a SIM was generated (because the disk array went down unexpectedly).
- Finally, the Ready LED (Figure 3 on page 29, item 1) will light green when the system is ready, which may take up to 10 minutes, depending on the number of disks installed in your disk array.
Specifications

Some of the HP StorageWorks Disk Array XP128 disk array specifications are listed in this section. For a complete set of environmental specifications, refer to the *HP Disk Array XP128 Site Prep Guide* on the following main web site and access the appropriate support product:

AC line voltage

The following AC power recommendations for the HP StorageWorks Disk Array XP128 are for each power cord. Each array frame has two power cords (with the AC power cord option there are four cords). In case of a failure of the power source for one cord, the power requirements and the current requirement for the remaining power cord will double.

Table 7 (page 42) lists the basic AC power requirements for a 50-amp single-phase XP128 DKU. Table 8 (page 43) lists the basic AC power requirements for a 30-amp single-phase XP128 DKU.

XP1024 hardware
General safety guidelines

Read the following safety guidelines carefully and follow them when you work with your XP1024 disk array.

- Remember that maintenance of your machine must be done only by trained and qualified HP field engineers. Only an HP service representative can power off the disk array.
- Please read and follow the safety guidelines and procedures in this manual and any of your related manuals.
- In this manual and on the machine, hazard warnings are provided to aid you in preventing or reducing the risk of death, personal injury, or product damage. Understand and follow these hazard warnings fully.
- The hazard warnings that appear on the warning labels on the machine or in the manual have one of the following alert headings consisting of an alert symbol and a signal word, “Warning,” or “Caution”:

**Warning**

This indicates a potentially hazardous situation which, if not avoided, can result in death or serious injury.

**Caution**

This indicates a hazardous situation which, if not avoided, will or can result in serious damage of product or loss of data.

- The signal word “NOTICE” is used to present warnings that are not directly related to personal injury hazards.
- When warning labels become dirty or start peeling off, replace them.
- If any physical accident such as abnormal noise, smell, or smoke occurs on the disk subsystem while running, immediately power off
the disk subsystem by pulling the UNIT EMERGENCY POWER OFF switch on the disk subsystem.

- Do not power off the system unless it is in an emergency power-off state.
- Keep the front and rear doors closed at all times.
- Keep the tops and sides of the cabinets clear to allow air to flow properly.
- Do not perform any procedures not described in this document. If you have any questions or concerns, please contact your HP service representative.

---

**Warning**

Do not touch areas marked HAZARDOUS, even with the power off. These areas contain high-voltage power.

Keep in mind that the hazard warnings in this manual or on the machine cannot cover every possible case, as it is impossible to predict and evaluate all circumstances before hand.

Be alert and use your common sense. If you have any questions, contact your HP service representative.
Physical components

The HP Disk Array XP1024 is a high-performance RAID-capable disk array system. It is used to store large quantities of data in an efficient and secure manner.

Minimum Disk Subsystem

![Diagram of HP StorageWorks 1024 Disk Array]

Figure 5. HP StorageWorks 1024 Disk Array
The maximum HDD configuration for an XP1024 with XP512 DKUs is 768. This is due to specifications for the 3 XP512 DKUs, which can contain a total of 256 HDDs (96+96+64).
The disk array has the following major hardware components:

- One disk control frame (DKC)
  
  The single disk control frame cabinet contains the control panel, connection hardware, the service processor, and control boards for the disk arrays.

- One to four XP1024 disk array frames (DKU) or
- One to two XP1024 disk array frames and one to three XP512 DKU frames.

  The DKU cabinets contain your disk drives.
  
  When using only XP1024 DKUs, you can connect up to 4 DKUs.
  
  When connecting XP512 DKUs to the XP1024 disk array, the supported configuration is a maximum of 2 XP12024 DKUs on the right, and a maximum of 3 XP512 DKUs on the left.

---

**Warning**

XP1024 and XP512 DKUs may not be configured on the same side of the DKC. Only XP1024 DKUs may be installed on the right of the DKC and only XP512 DKUs may be installed on the left of the DKC in configurations that support both types of DKUs.

- One service processor (SVP)
  
  The SVP is an internally mounted notebook computer used for maintenance. The SVP is located in the disk control frame cabinet. The SVP is used by your HP service representative only.

- (Optional) second service processor
  
  This is available for users with extreme availability requirements. This is not a required feature.
Disk control frame

The disk control frame controls your disk array. It provides you with a control panel, power supplies, controller boards, and your service processor. See Figure 7.

![Control Panel](image)

*Figure 7. Disk Control Frame*

There is no single point of failure in the disk array. It is designed with redundant controllers and redundant power supplies, all of which can be removed or replaced without interrupting access to your data. Only your HP service representative can remove or replace hardware.
Control panel

The control panel is your view to the disk array. Once the disk array is powered on and running normally, there are no user operations required at the control panel, except in case of a power failure recovery. The control panel will be discussed in further detail later in this chapter.

Service processor

The service processor (SVP) is a built-in PC connected inside the disk control frame. The SVP gives your HP service representative a method to access the software system on the disk array.

Your HP service representative uses the SVP to configure, maintain, and upgrade your disk array software and hardware. The service processor also collects performance data on the disk array for diagnostic testing and analysis.

To protect the user’s security, the SVP does not have access to any user data stored on the disk array.

An optional service processor is available for users with extreme availability requirements. This is not a required feature.
Disk array frames

The disk array frames are where the physical disk drives, the disk groups, and any dynamic spare disk drives are located. You must have at least one disk array frame to operate the system, and you may have up to a maximum of four disk array frames installed on your system. If you have four disk array frames that are fully populated with disk drives, you will have a maximum of 149 TB. You may also have one to two XP1024 disk array frames grouped with one to three XP512 DKU frames.

Figure 8. XP1024 Disk Array Frames
Available disk drives

The disk array uses 3.5-inch disk drives, and a variety of disk capacities are available. Ask your HP service representative about currently available disk drives. Any of the disk drives in your disk array frames can be replaced without disrupting user activity. The disk array automatically detects and corrects disk errors. All HP Disk Array XP512 disk drives are supported in XP512 DKU frames.

XP512 DKUs can be used in conjunction with the XP1024.
**RAID options**

Any of your spare disk drives can back up any other disk drive of the same or lesser capacity (and equal rotational speed), in any DKU frame, even if the failed disk and the spare disk are in different array domains, whether you are using RAID1 or RAID5 array groups.

XP512 DKU Supported disk drives must have a spare drive in the XP512 DKU domain(s).

Your disk arrays can be configured with a minimum of one and a maximum of 16 spare disk drives.

**Device Manager server (optional)**

The Device Manager server is for user access to the system software. Your Device Manager server runs a main remote control application and other standard and optional software to manage and monitor the disk array. The Device Manager server can be connected to multiple disk arrays using a special LAN connection. See Figure 10. See Table 10 on page 56.
The specific hardware requirements for your Device Manager server, such as the required processor speed, storage capacity, and memory, vary depending on the optional software that you use and the number of disk array frames you have connected to the system.

To protect your user’s security, neither edition of HP Command View software for the Device Manager server (CVXP or CVXP AE) has access to any user data stored on the disk array.

There is no single point of failure in the disk array. It is designed with redundant logic assemblies, disk drives, and the power supplies, all of which can be removed or replaced without interrupting access to your data.

**Caution**

*Only your HP service representative can remove or replace hardware.*

Emergency power-off

A switch is provided on the operator panel on the front side of the disk control frame (DKC) for turning power off in an emergency.

If you encounter any abnormality such as an abnormal sound, smell, or smoke, power off the disk subsystem by operating the UNIT EMERGENCY POWER OFF switch following the procedure below. The procedure for operating the switch is as follows:

1. Push the operator panel cover at the location where PUSH is marked, open the operator panel cover, then operate the EMERGENCY POWER OFF switch.

2. In using a UNIT EMERGENCY POWER OFF switch, first pull it up and then pull it toward you as illustrated in the figure below.

**Caution**  
Pulling a UNIT EMERGENCY POWER OFF switch on the disk controller instantly shuts down, neglecting the system's power-off sequence. Jobs in process are aborted and their integrity after recovery is not guaranteed. Therefore, this method should be used only in an emergency and not in usual maintenance.

**Caution**  
The UNIT EMERGENCY POWER OFF switch on the disk controller only provides partial power-off capability. AC input power remains present at the primary circuit. Therefore, do not use the switches on these units unless you need to power off of the unit as an emergency measure.

When pulled, the UNIT EMERGENCY POWER OFF switch mechanically locks itself in the off position to prevent restoring power in a potentially hazardous situation. A qualified HP service representative is required on site to restore power. Any time the unit Emergency/Only OFF switch is pulled, place a service call to Hewlett-Packard to have the switch reset and have the disk array restored to service.
Figure 12. Pulling Unit Emergency Power OFF Switch
Normal operations

The disk array does not require intervention from the user. The disk array reports any remote system information messages (R-SIMs) to your Device Manager server running HP Command View XP or Command View XP Advanced Edition. The internal disk array service processor also sends the report to the HP Service Center automatically. For more information on SIMs, see Chapter 5, "Troubleshooting" on page 87
Powering down the disk array

Situations may arise in the operation of the disk array that require the user to power down the disk array. These situations include:

- Emergency power-off
- Planned power-off

Emergency power-off

An emergency is a critical situation such as a physical plant catastrophe. In an emergency, the critical need is to quickly remove power from the disk array. A quick restart is not necessary.

In an emergency, you should trip the Emergency Power-Off (EPO) switch, which is located on the control panel.

Caution

Use this switch only in case of an emergency. An HP service representative is required to reset the EPO and to power-on the disk array.

To power off the disk array in an emergency:

1. Open the control panel cover by pushing on the point marked PUSH.

2. Pull the emergency power-off switch (Figure 12 on page 63) up and then out towards you as illustrated on the switch.

3. Call the HP support center. The EPO switch must be reset by an HP service representative before the disk array can be powered on again.
Planned power-off

There may be times when a site power outage is planned, such as to make alterations to the data center, do inspections, or to allow work by the electric company. If a scheduled power outage affects an HP Disk Array XP1024, the power down of the disk array must be scheduled with a trained HP support representative.

Caution

Only a trained HP representative may shut-down and power-off a disk array. Shutting down and powering off a disk array should not be done by customers except in an emergency.

When planning for your planned power outage, please contact your HP customer engineer to schedule a customer visit.
Recovering from a power outage to the disk array

If a power outage to the array occurs, the disk array will maintain its state and recover when power is restored. The array cache is backed up by batteries that will maintain its state for a minimum of 48 hours. This length of time will provide coverage for most outages. In cases where the outage will extend beyond 48 hours, the batteries can be replaced by an HP CE which will extend the time, if necessary. You must notify HP support if your power outage is expected to extend beyond the backup time.
Manual restart of the disk array after power is restored

Caution  Before restoring power to the disk array, HP recommends that an electrician check the input power to ensure it is stable and clean.

You may call a trained HP representative or you may use the following procedure yourself to recover the disk array from a power failure:

1. Move the ENABLE/DISABLE switch to the ENABLE position. Move the PWR ON/OFF switch to the PWR ON position. (Figure 11 on page 57, item 11/12)

2. The following LED power sequence will occur:
   - The BS-ON (Figure 11 on page 57, item 9) will turn amber and the PS ON LED (Figure 11 on page 57, item 10) will turn green.
   - The CHANNEL LED (Figure 11 on page 57, item 7) will light green for every adapter installed.
   - The MESSAGE LED (Figure 11 on page 57, item 3) may turn amber, if your disk array is not configured for automatic maintenance notification, signifying a SIM was generated (because the disk array went down unexpectedly).
   - Finally, the READY LED (Figure 11 on page 57, item 1) will light green signifying the system is ready. Powering on the disk array may take up to 10 minutes, depending on the number of disks installed in the disk array. Power-on is complete only when the READY LED turns green.

3. Move the ENABLE/DISABLE switch to the DISABLE position.
Automatic power on restart

**Caution**  As with all sophisticated electronic equipment, unstable power conditions during a restart can induce problems. HP recommends automatic power on restart only when power to the disk array is conditioned to ensure it is stable, such as by using a UPS. If your site does not have a UPS, HP recommends the disk array be configured for manual restart by keeping the ENABLE/DISABLE switch in the DISABLE position and using the manual restart procedure when power has been restored and verified.

The disk array will automatically restart and return to service when power is restored. To enable this feature, place the ENABLE/DISABLE switch in the ENABLE position and the PWR ON/OFF switch in the PWR ON position. (Figure 11 on page 57, item 11/12). When power is restored, your disk array will restart and the following LED power sequence will occur:

- The BS-ON (Figure 11 on page 57, item 9) will turn amber and the PS ON LED (Figure 11 on page 57, item 10) will turn green.
- The CHANNEL LED (Figure 11 on page 57, item 7) will light green for every adapter installed.
- The MESSAGE LED (Figure 11 on page 57, item 3) may turn amber, if your disk array is not configured for automatic maintenance notification, signifying a SIM was generated (because the disk array went down unexpectedly).
- Finally, the READY LED (Figure 11 on page 57, item 1) will light green when the system is ready, which may take up to 10 minutes, depending on the number of disks installed in the disk array.
Specifications

Some of the XP1024 disk array specifications are listed in this section. Refer to the HP Disk Array XP1024 Site Prep Guide on the XP1024 website at the following main website and access the appropriate product for a complete set of XP1024 specifications:

http://www.hp.com

If you intend to use HP Disk Array XP512 DKUs with your HP XP1024 Disk Array, see the *HP StorageWorks Disk Array XP512 Site Preparation Guide* for power requirements information for these DKUs.
Several optional HP software packages are available to increase your data accessibility and enable continuous access to user data on the disk array. This chapter describes how these optional software applications can help you run your disk array system.

Before installing the optional software packages, refer to the package’s manual to verify equipment requirements.
XP array management

Remote Web Console (RWC) is the standard management software package for the XP disk array. It provides a web-based interface for managing one disk array and is built into the SVP. To access RWC, you open a browser and enter the IP address of the SVP.

RWC allows you to install and manage the disk array but does not allow you to manage multiple arrays. To manage multiple XP disk arrays, install the Command View XP Advanced Edition optional software.

Command View XP Advanced Edition (CVXP AE) provides a browser-based common management platform from which you can manage the XP family of disk arrays. CVXP AE installs on a Device Manager server that you provide and from there can manage multiple XP arrays—even globally distributed arrays.

Remote Web Console XP and/or Command View XP Advanced Edition provide:

- Web-browser based GUI interface
- Visual representation and management of host and storage resources
- Common user interface for launching XP management applications
- Security through authentication, authorization, and encryption
- Event level integration into the leading network and system management solutions such as OpenView Network Node Manager, CA Unicenter TNG, Tivoli, and BMC Patrol
Storage management and LUN security

HP StorageWorks LUN Configuration and Security Manager XP

LUN Configuration Manager comes with three applications that are executed from Remote Web Console XP or StorageWorks Command View XP.

LUN Configuration Manager enables:

- LUN creation and port assignment
- consolidation of LUNs (up to 36 LUNs can be combined)
- creation of small size LUNs to accommodate data place in cache

Security Manager establishes security at the LUN level, allowing you to enable secure multiple server connectivity to the disk array. Secure Manager XP enables the disk array to hide LUNs assigned to one server from other servers.
Remote and local data replication

Continuous Access XP, Continuous Access Extension XP, and Business Copy XP are valuable tools for creating copies of data for testing, backup, and disaster recovery.

**HP StorageWorks Continuous Access XP**

Continuous Access allows you to make ongoing synchronous copies of disk array data to a remote site 27 miles (43 kilometers) away.

**HP StorageWorks Continuous Access Extension XP**

Continuous Access Extension XP is similar to Continuous Access XP, but operating in asynchronous mode. This can produce increased performance in remote copying. Copy operations are sequenced-stamped to ensure they are executed and sorted correctly at the remote disk array.

You must purchase Continuous Access Extension as an upgrade if you are currently using the Continuous Access XP in synchronous mode, but would prefer to use asynchronous mode.

**HP StorageWorks Business Copy XP**

Business Copy allows you to make up to nine ongoing copies of data. These copies are maintained on the local disk array. Use Business Copy for non-production activities such as backup, batching, and system testing.
Failover and load balancing

HP StorageWorks Auto Path XP

Using Auto Path XP, you can enable Windows NT server I/O path failover and load balancing control for dual path connections. You can configure up to eight multiple paths per LUN that will provide automatic and transparent failover in the event of path failure. You can also enable dynamic, multi-path load balancing to prevent overloaded I/O operations.

HP StorageWorks Secure Path

HP StorageWorks Secure Path is a family of high availability multi-pathing software products providing continuous data access from the disk array to host servers running Windows Server 2003, Windows 2000, Windows NT, Linux, Sun Solaris, Novell NetWare, IBM AIX, and HP-UX.

Redundant hardware, advanced RAID technology and Secure Path’s automated failover capability enhance fault tolerance and availability. Secure Path effectively eliminates controllers, disk drives, interconnect hardware and host bus adapters as single points of failure. Secure Path:

• Ensures increased business efficiency by maintaining high availability of business critical data and by simplifying the task of path management.

• Monitors path status, and in the case of a path failure, automatically re-routes data to an alternate path.

• Allows easy path management from a single application with graphical displays and task automation.
Performance management

**HP StorageWorks Cache LUN XP**

Cache LUN XP enables you to reserve disk array cache memory for storing high-use data, greatly increasing access speed to that data.

**HP StorageWorks Auto LUN XP**

Auto LUN XP provides monitoring and disk usage analysis for your disk array based on user thresholds. Auto LUN develops a plan to migrate impacted data volumes to lower usage LUNs, using the data acquired during monitoring. You can perform the migration manually or automatically.

**HP StorageWorks Performance Advisor XP**

HP StorageWorks Performance Advisor XP is an Internet application used to monitor real-time performance of the HP StorageWorks XP family of disk array products. Using a simple, browser-based interface, you can quickly customize performance data collection and set performance alarms. Performance Advisor provides real-time and historical data on:

- LDEV I/Os
- front-end and back-end port utilization
- internal bus utilization
- cache usage

You can easily integrate with VantagePoint’s DSI log and user PerfView to view your performance metrics.
HP StorageWorks Application Policy Manager XP

HP StorageWorks Application Policy Manager XP is a performance allocation and management tool for XP disk arrays. It lets you allocate storage performance resources to hosts by means of policies you define.

It ensures that critical business processes have all the XP disk array performance they need to meet business objectives. You can ensure that processes such as backups and data warehouse loads get the array bandwidth necessary to meet deadlines. Application Policy Manager enables sophisticated service provider solutions based on distinct levels of service.

Application Policy Manager has a rich feature set for flexible policy definition, scheduling, monitoring, and analysis.
Network management products

HP OpenView SPI for XP Disk Arrays

HP OpenView SPI for XP Disk Arrays establishes an agent that monitors XP disk arrays, provides a correlation of events on the disk arrays, and then forwards those events to the OpenView Operations management console.

HP OpenView SPI for HP storage devices

The OpenView SPI solutions enable integration of the XP disk array infrastructure into the OpenView Operations and OpenView Service Navigator, providing you with the ability to integrate storage into your service level agreements. These solutions perform the following functions:

- Intercept and filter over 1,000 events from the XP disk array
- Show associations and dependencies existing between XP components
- Isolate root causes of failures and predict results
- Enable management of globally distributed XP disk arrays from the OpenView management console
Mainframe solutions

HP StorageWorks Resource Manager XP

HP StorageWorks Resource Manager XP allows you to share data stored on the disk array with mainframe systems and open system servers. This can reduce and optimize your storage maintenance and management overhead.

HP StorageWorks Resource Manager XP allows an XP array to connect to a mainframe system via an ESCON link.

HP StorageWorks Data Exchange XP

Data Exchange XP provides high-speed bidirectional data sharing between mainframe systems and open systems. File translations are provided through a file conversion utility.

Together, these products can free your network of host-to-host data conversion traffic.
This chapter explains the monitoring and reporting capabilities and the flow of troubleshooting used on the HP StorageWorks Disk Array family of disk arrays.
Monitoring and reporting

The disk array generates service information messages (SIMs) to identify normal operations, service requirements, and failures. SIMs can be generated on the disk array by the CHIP (Client Host Interface Processor) and ACP (Array Control Processor) microprocessors and by the internal service processor (SVP). Your HP service representative will use the SIMs to monitor and troubleshoot your disk array.
When the system encounters trouble, it will report the trouble to the HP Storage Technology Center.

If a failure occurs in the disk array, it is detected and reported to the system log, the SIM log, and the HP Storage Technology Center. Figure 13 is a flow diagram that explains the progress of error detection and reporting.

1. A failure is detected in your disk array.

2. The failure is reported to the system.

3. The system stores the failure information in the system log.

   The generated SIMs are stored on your disk array’s SVP for use by HP personnel. The Continuous Track remote maintenance software tool also reports SIMs to the HP Storage Technology Center. When a SIM is generated, the amber message LED on your disk array control panel turns on if the disk array is not configured to automatically phone the HP Storage Technology Center. In this case, call HP to determine the reason for the message.

   SIMs are classified according to severity: service, moderate, serious, or acute. Service-level and moderate-level SIMs do not require immediate attention and are addressed during routine maintenance. These failures are often corrected before the failure actually occurs.

   Serious-level and acute-level SIMs are reported to the HP Storage Technology Center immediately to ensure that the problem is addressed as soon as possible. Your HP service representative will configure your modem during installation.

4. The Continuous Track remote maintenance tool reports the SIMs to the HP Storage Technology Center through a dedicated dial up connection.

   The HP Storage Technology Center then takes action to correct the failure.
Figure 13. Error Detection and Reporting
The following regulatory statements apply to the HP Disk Array XP128 and XP1024.
FCC EMC Statement (USA)

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at his or her own expense. The end user of this product should be aware that any changes or modifications made to this equipment without the approval of Hewlett-Packard could result in the product not meeting the Class A limits, in which case the FCC could void the user’s authority to operate the equipment.

Hewlett-Packard’s device certification tests were conducted with HP computer systems and HP shielded cables, such as those you received with your product. Changes or modifications not expressly approved by Hewlett-Packard could void the user’s authority to operate the equipment. Cables used with this device must be properly shielded to comply with the requirements of the FCC.
IEC Statement (Worldwide)

This is a Class A product. In a domestic environment this product may cause radio interference, in which case the user may be required to take adequate measures.
EMC Statement (Canada)

This Class A digital apparatus meets all requirements of the Canadian Interference-Causing Equipment Regulations.

Cet appareil numérique de la Classe A respecte toutes les exigences du Règlement sur le matériel brouilleur du Canada.
Spécification ATI Classe A (France)

DECLARATION D'INSTALLATION ET DE MISE EN EXPLOITATION d'un matériel de traitement de l'information (ATI), classé A en fonction des niveaux de perturbations radioélectriques émis, définis dans la norme européenne EN 55022 concernant la Compatibilité Electromagnétique.
この装置は、情報処理装置等電波障害自主規制協議会（VCCI）の基準に基づくクラスA情報技術装置です。この装置を家庭環境で使用すると電波妨害を引き起こすことがあります。この場合には使用者が適切な対策を講ずるよう要求されることがあります。
警告使用者：
這是甲類的資訊產品，在居住的環境中使用時，可能會造成射頻干擾，在這種情況下，使用者會被要求採取某些適當的對策的對策。

Laser Safety

When equipped with native Fibre Channel adapters or iSCSI adapters, this product contains a laser internal to the Optical Link Module (OLM) contained on the 4-port Fibre Channel Adapter board and 4-port FICON board, the 8-port Fibre Channel Adapter board and 8-port FICON board, and the 4-port iSCSI board for connection to a fiber communications network.

In the USA, the OLM is certified as a Class 1 laser product conforming to the requirements contained in the Department of Health and Human Services (DHHS) regulation 21 CFR, Subchapter J. The certification is indicated by a label on the plastic OLM housing. Outside the USA, the OLM is certified as a Class 1 laser product conforming to the requirements contained in IEC 825-1:1993 and EN 60825-1:1994, including Amendment 11:1996.

The following figure shows the Class 1 information label that appears on the plastic housing of the OLM.

CLASS 1 LASER PRODUCT

Complies with
21 CFR 1040.10 and 1040.11

Each communications port consists of a transmitter and receiver optical subassembly. The transmitter subassembly contains internally a semiconductor laser diode in the wavelength range of 770 to 850 nanometers. In the event of a break anywhere in the fibre path, the OLM control system prevents laser emissions from exceeding Class 1 levels. Class 1 laser products are not considered hazardous.

Warning

There are no user maintenance operations, service operations, or adjustments to be performed on the Optical Link Module.
Japan DENAN law cordset caution

Please use the supplied power cord. The power cord may not be used with other products.

Disposal of Waste Equipment by Users in Private Household in the European Union

This symbol on the product or on its packaging indicates that this product must not be disposed of with your other household waste. Instead, it is your responsibility to dispose of your waste equipment by handing it over to a designated collection point for the recycling of waste electrical and electronic equipment. The separate collection and recycling of your waste equipment at the time of disposal will help to conserve natural resources and ensure that it is recycled in a manner that protects human health and the environment. For more information about where you can drop off your waste equipment for recycling, please contact your local city office, your household waste disposal service or the shop where you purchased the product.

Απόρριψη χρήστου εξοπλισμού από χρήστες σε ιδιωτικά νοικοκυριά στην Ευρωπαϊκή Ένωση

Το σύμβολο αυτό στο προϊόν ή τη συσκευασία του υποδεικνύει ότι το συγκεκριμένο προϊόν δεν πρέπει να διατίθεται μαζί με τα άλλα οικιακά σας απορρίμματα. Αντιθέτως, είναι δική σας ευθύνη να απορρίπτετε τον χρήστο εξοπλισμό σας παραδίδοντας τον σε καθορισμένο σημείο συλλογής για την ανακύκλωση χρηστού ηλεκτρικού και ηλεκτρονικού εξοπλισμού.

Η έξοδος συλλογή και ανακύκλωση του χρηστού εξοπλισμού σας κατά την απόρριψη θα συμβάλει στη διατήρηση των φυσικών πόρων και θα διασφαλίσει ότι η ανακύκλωση γίνεται με τρόπο που προστατεύει την ανθρώπινη υγεία και το περιβάλλον. Για περισσότερες πληροφορίες σχετικά με το πώς μπορείτε να παραδώσετε τον χρήστο εξοπλισμό σας για ανακύκλωση, επικοινωνήστε με το αρμόδιο τοπικό γραφείο, την τοπική υπηρεσία διάθεσης οικιακών απορριμάτων ή το κατάστημα όπου αγοράσατε το προϊόν.

Noletotu iekārtu iznīcināšanas noteikumi lietotājiem Eiropas Savienībās privašajās mājsaimniecībās

Šīs simbols uz izstrādājuma vai uz tā iesaņojuma norāda, ka šo izstrādājumu nedrīkst izmest kopā ar otrie ka spalvās atkritumiem. Jūs atbild par to, lai noletotās iekārtas tiktu nodotas speciāli iekārtotos punktos, kas paredzēti izmantot elektro- un elektronisko iekārtu savākšanai un atkarīgiem pašstrādei. Atsevišķa noletoto iekārtu savākšana un atkarīgiem pašstrāde palīdzēs saglabāt dabas resursus un garantē, ka šis iekārtas tiek atkarīgiem pašstrādei tādā veidā, ka tas parādātu viņu un cilvēku veselību. Lai uzzinātu, kur noletotās iekārtas var izmest atkarīgiem pašstrādei, jāvēršas savas dzīves vietas pašvaldībā, sadzīves atkritumu savākšanas dienestā vai veikalu, kurā izstrādājums tieka nodrošināts.

Lithuanian

Vartotojų iš privačių namų ūkių įrangos atliekų šalinimas Europos Sąjungoje

Šis simbolis ant gaminio arba jo pakuotės rodo, kad šio gaminio šalinė kartu su kitomis gaminio ūkio atliekomis negalima. Šalintinas įrangos atliekais privalote pristatyti į specialią suformuotą vietą elektros ir elektroninės įrangos atliekoms perdirbti. Atskirių saugomos ir perdirbamos šalintinos įrangos atliekos padės saugoti gamtinius išteklius ir užtikrinti, kad jos bus perdirbtos tokiu būdu, kuris nekentėja žmonių sveikatai ir aplinkai. Jeigu norite sužinoti daugiau apie tai, kur galima pristatyti perdirbinas įrangos atliekas, kreipkitės į savo seniūniją, namų ūko atliekų šalinimo tarnybą arba pardavėją, kurioje įsigijote gaminį.
Polish

Pozbywanie się zużytego sprzętu przez użytkowników w prywatnych gospodarstwach domowych w Unii Europejskiej

Ten symbol na produkcie lub jego opakowaniu oznacza, że produkt nie wolno wyrzucać do zwykłych pojemników na śmieci. Obowiązkiem użytkownika jest przekazanie zużytego sprzętu do wyznaczonego punktu zbiórki w celu recyklingu odpadów powstałych ze sprzętu elektrycznego i elektronicznego. Osoba zbiórki oraz recykling zużytego sprzętu pomagają w ochronie zasobów naturalnych i zapewniam ponowne wprowadzenie go do obiegu w sposób chroniący zdrowie człowieka i środowisko. Aby uzyskać więcej informacji o tym, gdzie można przekazać zużyty sprzęt do recyklingu, należy się skontaktować z urzędem miasta, zakładem gospodarki odpadami lub sklepem, w którym zakupiono produkt.

Portuguese

Descarte de Lixo Elétrico na Comunidade Européia

Este símbolo encontrado no produto ou na embalagem indica que o produto não deve ser descartado no lixo doméstico comum. É responsabilidade do cliente descartar o material usado (lixo elétrico), encaminhando-o para um ponto de coleta para reciclagem. A coleta e a reciclagem seletivas desse tipo de lixo ajudam a conservar as reservas naturais; sendo assim, a reciclagem será feita de uma forma segura, protegendo o ambiente e a saúde das pessoas. Para obter mais informações sobre locais que recebem esse tipo de material, entre em contato com o escritório da HP em sua cidade, com o serviço de coleta de lixo ou com a baja em que o produto foi adquirido.

Slovak

Likvidácia vyradených zariadení v domácnostiach v Európskej únii

Symbol na výrobku alebo jeho balení označuje, že daný výrobok sa nesmie likvidovať s domovým odpadom. Povinnosťou spotrebitelia je odovzdať vyradené zariadenie v zbernom mieste, ktoré je určené na recykláciu vyradených elektrických a elektronických zariadení. Separovaný zber a recyklácia vyradených zariadení prispieva k ochrane prírodných zdrojov a zabezpečuje, že recyklácia sa vykonáva spôsobom chrániacim ľudske zdravie a životné prostredie. Informácie o zberných miestach na recykláciu vyradených zariadení vám poskytne miestne zastupiteľstvo, spoločnosť zabezpečujúca odvoz domového odpadu alebo obchod, v ktorom ste si výrobok zakúpili.
Slovenian

Odstranjevanje odslužene opreme uporabnikov v zasebnih gospodinjstvih v Evropski uniji

Ta znak na izdelku ali njegovi ambalaži pomeni, da izdela ne smete odvleči med gospodinjske odpadke. Nasprotno, odsluženo opremo morate predati na zbiralnico, podobno za recikliranje odslužene električne in elektronske opreme. Ločeno zbiranje in recikliranje odslužene opreme prispeva k ohranjanju naravnih virov in zagotavlja recikliranje te opreme na zdravju in okolju neškodljiv način. Za podrobnejše informacije o tem, kam lahko odpeljete odsluženo opremo na recikliranje, se obrnite na pristojni organ, komunalno službo ali trgovino, kjer ste izdelek kupili.

Spanish

Eliminación de residuos de equipos eléctricos y electrónicos por parte de usuarios particulares en la Unión Europea

Este símbolo en el producto o en su envase indica que no debe eliminarse junto con los desperdicios generales de la casa. Es responsabilidad del usuario eliminar los residuos de este tipo depositándolos en un "punto limpio" para el reciclado de residuos eléctricos y electrónicos. La recogida y el reciclado selectivos de los residuos de aparatos eléctricos en el momento de su eliminación contribuirá a conservar los recursos naturales y a garantizar el reciclado de estos residuos de forma que se proteja el medio ambiente y la salud. Para obtener más información sobre los puntos de recogida de residuos eléctricos y electrónicos para reciclado, póngase en contacto con su ayuntamiento, con el servicio de eliminación de residuos domésticos o con el establecimiento en el que adquirió el producto.

Swedish

Bortskaffande av avfallsprodukter från användare i privathushåll inom Europeiska Unionen

### Glossary

| **ACP** | Array control processor. The ACP handles the passing of data between the cache and the physical drives held in the DKUs. ACPs work in pairs, providing a total of eight SCSI buses. Each SCSI bus associated with one ACP is paired with a SCSI bus on the other ACP pair element. In the event of an ACP failure, the redundant ACP takes control. Both ACPs work together sharing the load. |
| **AL** | Arbitrated loop. |
| **AL-PA** | Arbitrated loop physical address. |
| **allocation** | The ratio of allocated storage capacity versus total capacity as a percentage. “Allocated storage” refers to those LDEVs that have paths assigned to them. The allocated storage capacity is the sum of the storage of these LDEVs. Total capacity refers to the sum of the capacity of all LDEVs on the disk array. |
| **array group** | A group of 4 or 8 physical hard disk drives (HDDs) installed in an XP disk array and assigned a common RAID level. RAID1 2D+2D array groups are made up of 4 HDDs. A RAID1 4D+4D group is two 4 HDD array groups concatenated together. RAID5 array groups are made up of 4 or 8 HDDs, depending on whether they are RAID5 3D+1P or RAID5 7D+1P, respectively. All RAID6 array groups are made up of 8 HDDs (6D+2P). |
| **ASE** | Application System Engineer. |
| **BC** | The HP StorageWorks Business Copy XP software program, which enables you to maintain up to nine internal copies of logical volumes on the disk array. |
| **C-Track** | The HP StorageWorks Continuous Track XP software program, which detects internal hardware component problems on a disk array and automatically reports them to the HP STC. |
| **CA** | The HP StorageWorks Continuous Access XP program, which enables you to replicate data stored on a local disk array to a remote disk array. |
| **cache** | Very high speed memory that is used to speed I/O transaction time. All reads and writes to the XP array family are sent to the cache. The data is buffered there until the transfer to/from physical disks (with slower data throughput) is complete.  

The benefit of cache memory is that it speeds I/O throughput to the application. The larger the cache size, the greater the amount of data buffering that can occur and the greater throughput to the applications.  

XP arrays support a range of cache memory. In the event of power loss, battery power holds up the contents of cache for up to 36 hours. |
| **CE** | Customer engineer. |
| **channel adapter (CHA)** | The channel adapter (CHA) provides the interface between the disk array and the external host system. Occasionally this term is used synonymously with the term channel host interface processor (CHIP). |
| **channel host interface processor (CHIP)** | Synonymous with the term channel adapter (CHA). |
| **channel processor (CHP)** | The processors located on the channel adapter (CHA). Synonymous with CHIP. |
| **command device** | A volume on the disk array that accepts Continuous Access or Business Copy control operations which are then executed by the disk array. |
| **control unit** | To organize the storage space attached to the DKC, you can group similarly configured logical devices (LDEVs) with unique control unit images (CUs). CUs are numbered sequentially. The disk array supports a certain number of CUs, depending on the disk array model. Each CU can manage multiple LDEVs. Therefore, to uniquely identify a particular LDEV requires both the CU number and the LDEV number. |
CU  Control unit.

CVS  Custom volume size. CVS devices (OPEN-x CVS) are custom volumes configured using array management software to be smaller than normal fixed-size OPEN system volumes. Synonymous with volume size customization (VSC).

disk adapter (DKA)  Synonymous with the term ACP.

disk unit (DKU)  The array hardware that houses the disk array physical disks.

disk controller (DKC)  The array hardware that houses the channel adapters and service processor (SVP).

disk recovery and restore unit (DRR)  The unit responsible for data recovery and restoration in the event of a cache failure.

disk group  The physical disk locations associated with a parity group.

disk type  The manufacturing label burned into the physical disk controller firmware. In most cases, the disk type is identical to the disk model number.

emulation modes  The logical devices (LDEVs) associated with each RAID group are assigned an emulation mode that makes them operate like OPEN system disk drives. The emulation mode determines the size of an LDEV.

OPEN-3: 2.46 GB
OPEN-8: 7.38 GB
OPEN-9: 7.42 GB
OPEN-E: 13.56 GB
OPEN-K: Not available on this disk array
OPEN-L: 36 GB
OPEN-M Not available on this disk array
OPEN-V: User-defined custom size

EPO  Emergency power-off.

ESCON  Enterprise System Connection (the IBM trademark for optical channels).

expanded LUN  A LUN is normally associated with only a single LDEV. The LUSE feature allows a LUN to be associated with 1 to 36 LDEVs. Essentially, LUSE makes it possible for applications to access a single large pool of storage.
The LUSE feature is available when the HP StorageWorks LUN Configuration Manager product is installed.

**ExSA**
Extended serial adapter.

**failover**
Disconnecting a failed unit or path and replacing it with an alternative unit or path in order to continue functioning.

**FC**
Fibre Channel.

**FC-AL**
Fibre Channel arbitrated loop.

**FCP**
Fibre Channel Protocol.

**fence level**
A level for selecting rejection of a write I/O request from the host according to the condition of mirroring consistency.

**FICON**
IBM mainframe Fiber Optic Connection.

**GB**
Gigabytes.

**GLM**
Gigabyte link module.

**HA**
High availability.

**HBA**
Host bus adapter. A built-in function or a card installed in a PC or other host computer to enable connection of the host to the SAN.

**host mode**
Each port can be configured for a particular host type. These modes are represented as two-digit hexadecimal numbers. For example, host mode 08 represents an HP-UX host.

**hot standby**
Using two or more servers as a standby in case of a primary server failure.

**HP**
Hewlett-Packard Development Company.

**I/O**
Input/output (applies to an operation or device).

**LAN**
Local area network.

**LD, LDEV**
Logical device. An LDEV is created when a RAID group is carved into pieces according to the selected host emulation mode (that is, OPEN-3, OPEN-8, OPEN-9). The number of resulting LDEVs depends on the selected emulation mode. The term LDEV is often used synonymously with the term volume.
<table>
<thead>
